

Catching Vulnerabilities and Trapping Exploits

Canary Trap's elite team of security experts come armed with the tools, experience and credentials to help improve your organization's security resiliency and cyber risk posture.

WEB & MOBILE APPLICATION PENETRATION TESTING

Hardening web and mobile applications.

SERVICE OVERVIEW

Businesses of all shapes and sizes depend more and more on websites, web and mobile applications as tools for commerce, customer engagement and data collection. As such, these properties have evolved to become very valuable targets for cybercriminals and, as such, need to be secured.

A 2021 report by NTT Application Security shows that 50% of all web applications were vulnerable to attack. Organizations of all shapes and sizes continue to struggle against the rising tide of application-specific and web-application attacks.

To ensure a high standard of security, web and mobile applications should be regularly tested for security vulnerabilities. When performed regularly, penetration testing will illuminate where vulnerabilities exist so that you can remediate before cybercriminals can locate and exploit them.

Penetration testing will identify weaknesses that exist within your security model. Committing to undertake regular offensive security (penetration) testing ensures that your business can remain vigilant and resilient to new threats. Undertaking web and mobile application penetration testing can assist with improved planning when it comes to business continuity and disaster recovery.

Canary Trap combines human expertise with sophisticated tools, proven methodologies and, where appropriate, threat intelligence to ensure a thorough, in-depth approach to security testing and assessments.
